

Iowa DNR's Ambient Groundwater Quality Monitoring Program

National Ground Water Monitoring Network – December 2017

Claire Hruby, PhD

Iowa Department of Natural Resources

Ambient Groundwater Quality Monitoring Coordinator

Program Summary

- Original collaboration between USGS and Iowa Geological Survey (IGS) and State Hygienic Laboratory (SHL): 1982 – 2006
- Original random design, stratified by aquifer – modified over time
- Sampling plan varied over the years, with more frequent sampling of vulnerable aquifers/wells
- Additional projects related to private wells, springs, and dedicated monitoring wells
- Data gap from 2007-2011, resumed in 2012, virus and pharm study in 2013
- Groundwater quality monitoring became responsibility of Iowa DNR in 2014 after IGS became part of the University of Iowa
- Parameters include pH, temp, major ions, metals, nutrients, radionuclides, tritium, VOC's, pesticides, pathogens, microbial indicators, and pharmaceuticals
- Most analyses by SHL at the University of Iowa
- Supplemental analyses by USGS laboratories (and others)
- Sample collection by trained IGS, IDNR, SHL, or USGS staff when methods require
- Annual sample collection by municipal water operators for basic analytes (timing has shifted from summer to winter)
- QA/QC: Always 10% duplication by trained staff, plus field blanks

Iowa's Ambient Groundwater Quality Monitoring Goals

1. To characterize the quality of groundwater by aquifer and region
2. To evaluate long-term trends in groundwater quality
3. To assess new or emerging issues of groundwater quality concern

General Plan

- Sample Vulnerable Wells Annually (focus on surface-related contaminants)
- Sample Confined Buried Sands and Bedrock wells every 5 years (focus on natural contaminants)
- Special Projects when resources are available (e.g. Viruses and pharmaceuticals, neonics, isotopes)
- 250 wells sampled since 2002 for >400 analytes

Status of NGWMN Project

PLAN: Link a subset of 137 actively monitored sites (wells) to NGWMN for water quality

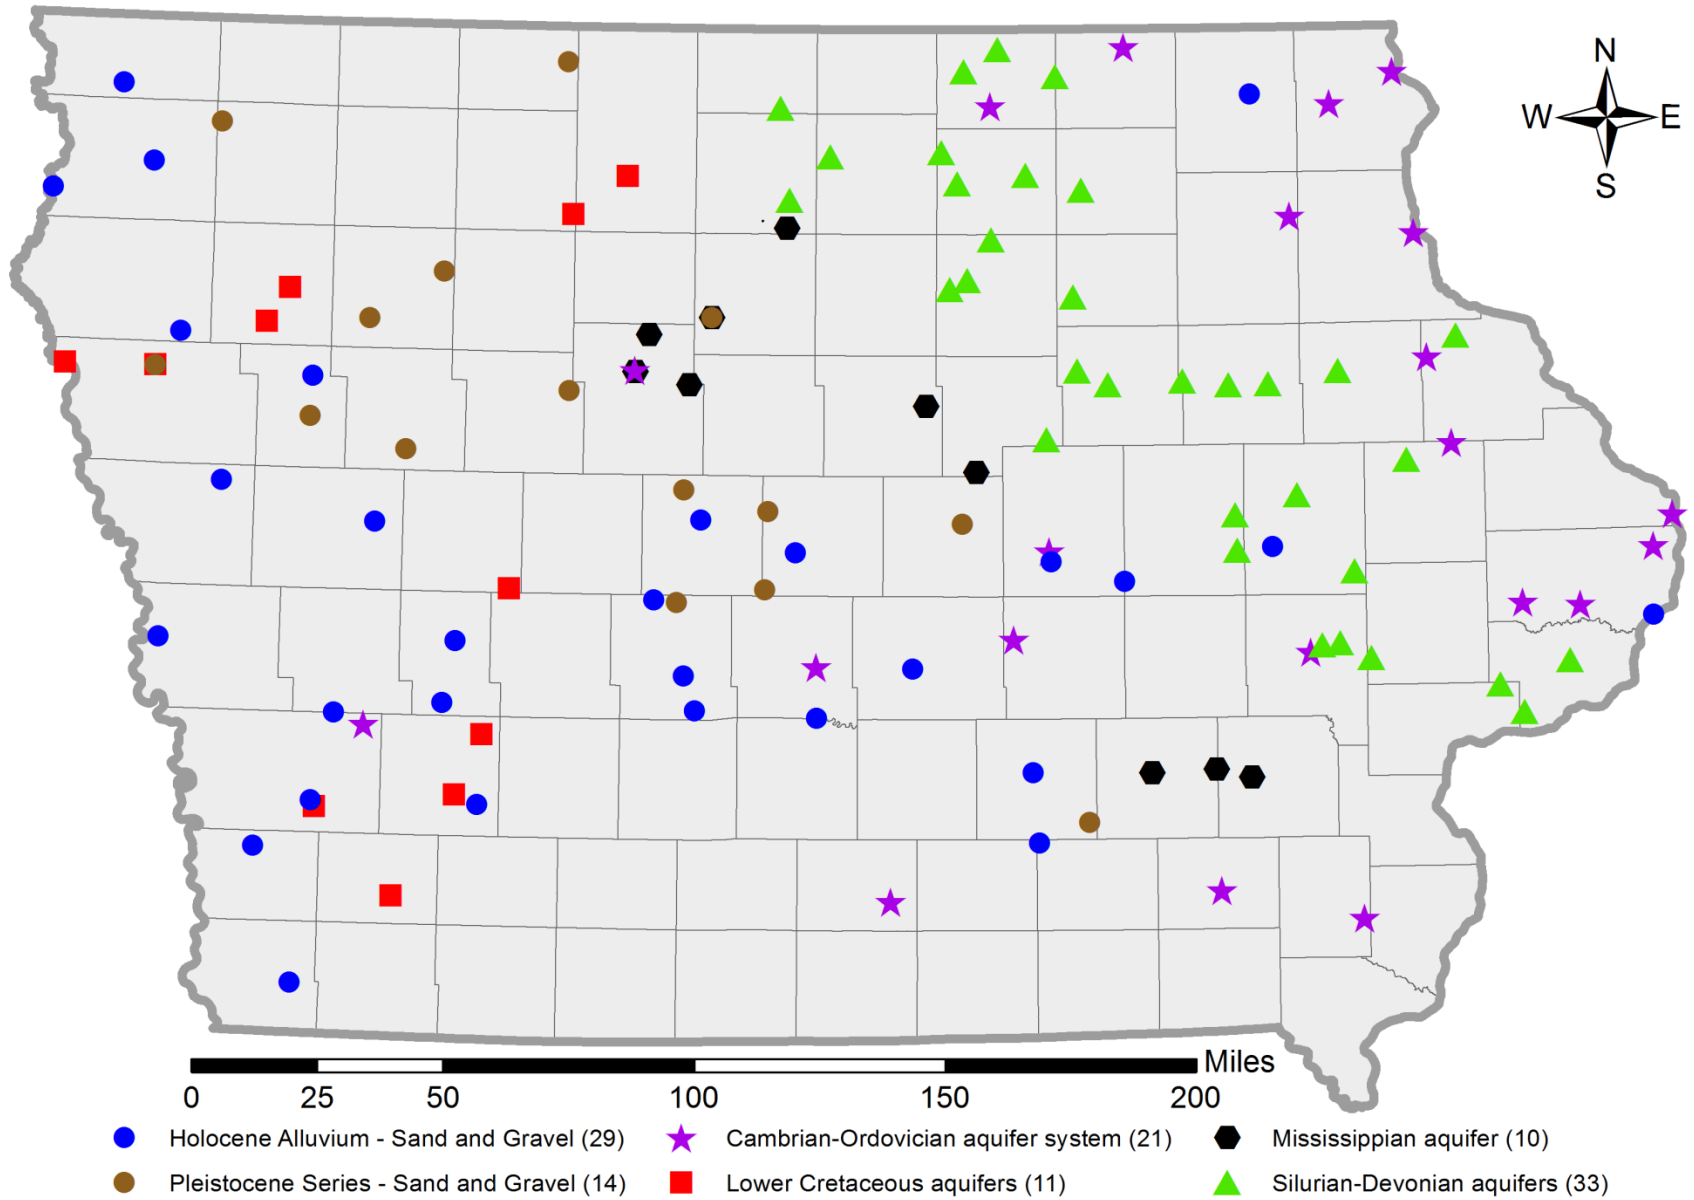

- **Task 1:** Selected 118 wells (further refinement possible)
- **Task 2:** Subnetwork classification based on water quality completed. Categories assigned based on planned monitoring frequency. Backbone trend wells monitored pre-2000, annually from 2002-2006, and annually since 2014.
- **Task 3:** Local and national aquifer codes identified, but some consultation required for mismatched codes. Well construction and lithology will come from IIHR/IGS GEOSAM database. *(Site ID question remains: STORET is preferred to facilitate use of data portal, but also a need to be consistent with IGS, so use of Geosam well ID is preferred. Is use of USGS ID only way to link to NWIS?)*
- **Task 4:** Plan to begin using Well Registry after January 1 once ID issue is addressed.
- **Task 5:** Script for transforming **most** lab data to WQX is available. Jamie Mootz is very familiar with creating webservice, if necessary.

| | 2017 | | | | | | 2018 | | | | | |
|-------------------------|------|-----|------|-----|-----|-----|------|-----|-----|-----|-----|------|
| Task | July | Aug | Sept | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | June |
| 1 - Site Selection | █ | █ | █ | | | | | | | | | |
| 2 - Site Classification | | | █ | █ | █ | | | | | | | |
| 3 - Data elements | | | | | █ | █ | | | | | | |
| 4 - Well Registry | | | | | | █ | █ | █ | | | | |
| 5 - Database linkage | | | | | | | █ | █ | █ | █ | █ | █ |
| 6 - Reporting | | | | | | | | | █ | █ | █ | █ |

Site Selection Criteria

- Monitored multiple times since 2014
- Municipality likely to maintain well in active or standby mode
- Cooperative municipal operator
- Some reduction due to proximity - No more than one well per aquifer per community
- Limited due to density of recommended glacial sites (?)

NGWMN Selected Wells from Iowa Ambient Groundwater Monitoring Network

Draft Subnetwork Criteria

Documented changes

- Nitrate + nitrite as N > 2 in more than 1 sample
- And/Or Detection of pesticides in more than 1 sample

Suspected changes (at least 2 of the following)

- Nitrate detected, but < 2 mg/L
- Detection of pesticides in 1 sample
- Pharmaceutical detected (USGS method)
- Virus or bacteria by qPCR (Borchardt)
- Microbial indicators detected

Background conditions

- No nitrate, pesticides, pharmaceuticals, or microbial contaminants detected

Unclassified

- Less than 5 years of data available

From 2013:

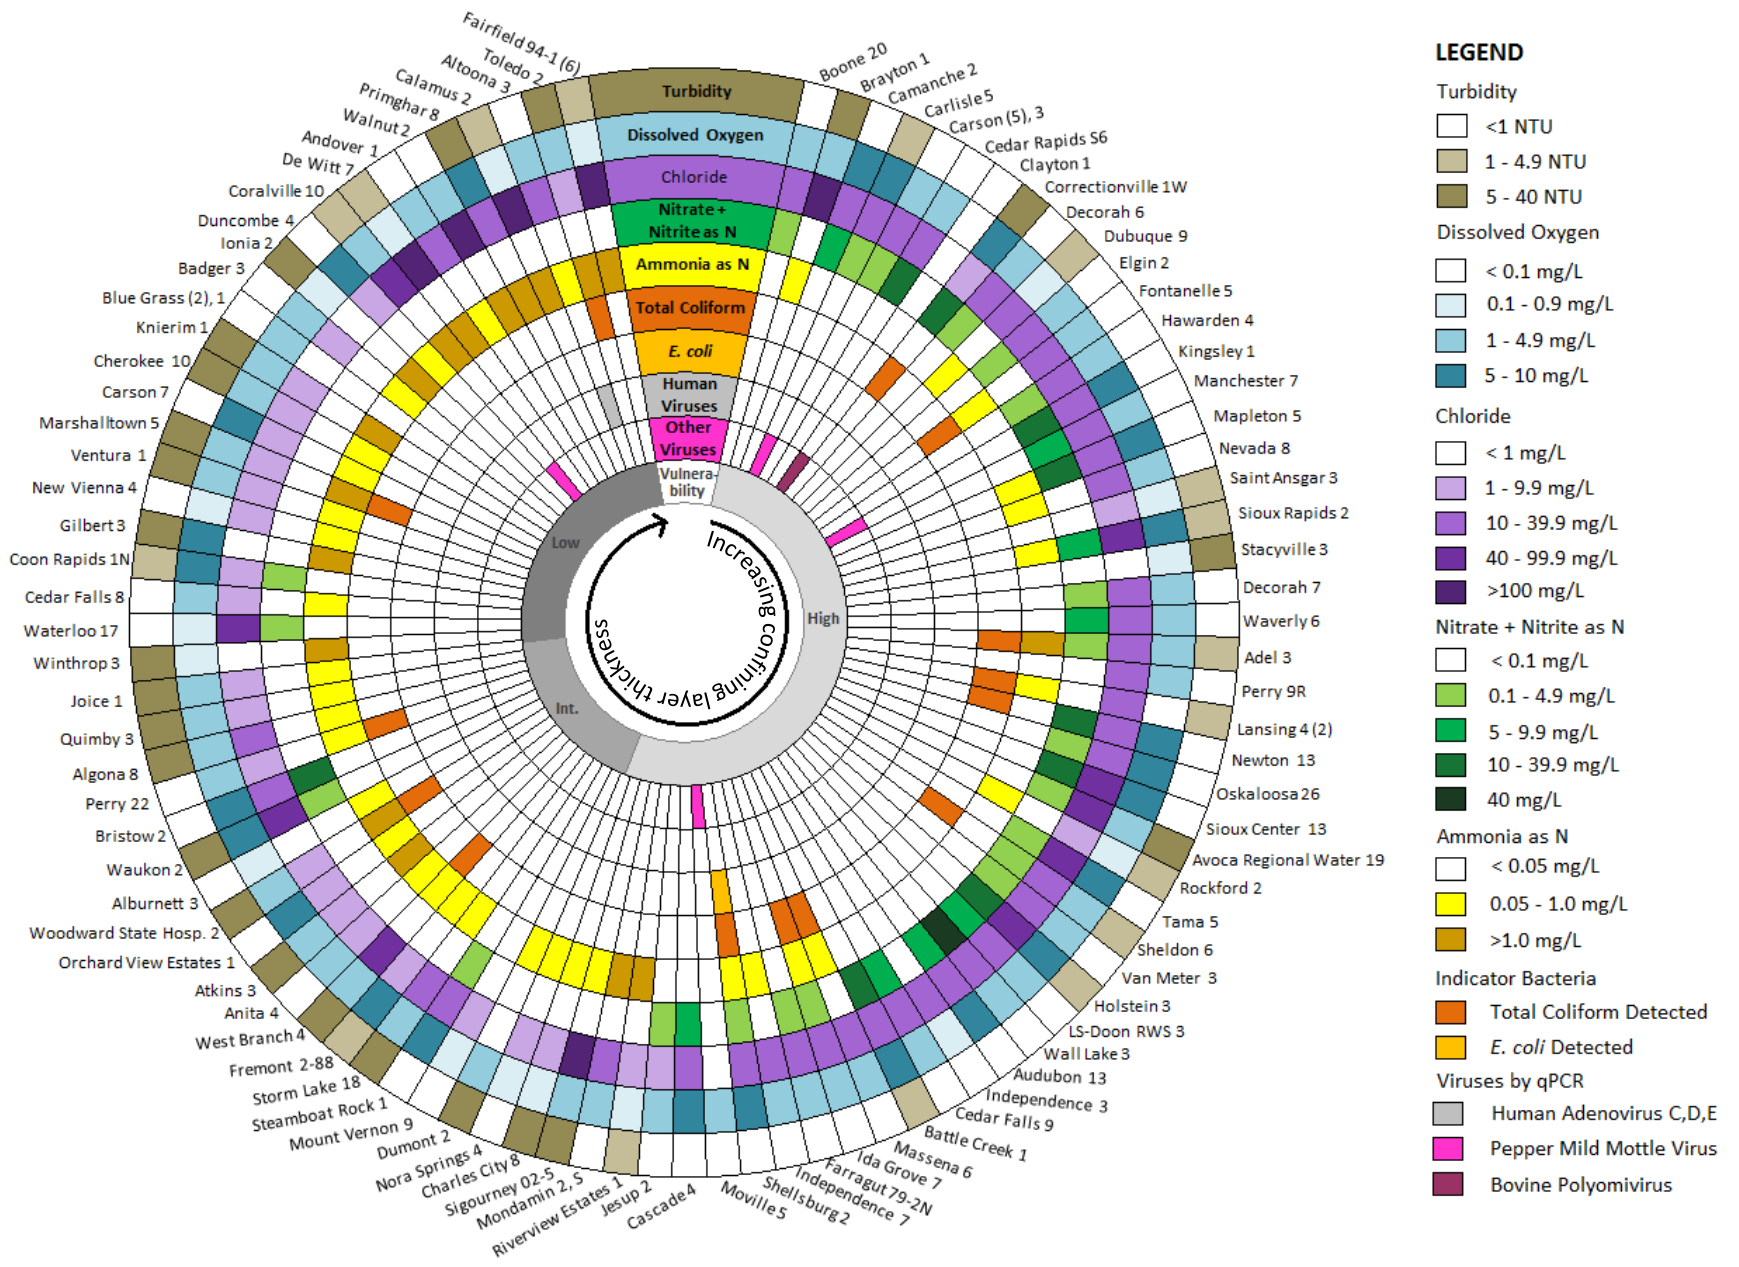

Most Vulnerable
(based on estimated
confining layer thickness)

LEGEND

- Pesticide Detected
- Tritium Detected
- No Tritium Analysis
- Pharmaceutical Detected
- Nitrate + Nitrite as N > 2.0 mg/L
- Nitrate + Nitrite as N <= 2.0 mg/L
- Pepper Mild Mottle Virus Det.
- Bovine Polyomavirus Det.
- GII Norovirus Det.
- Human Polyomavirus Det.
- Campylobacter Det.
- Total Coliform Bacteria Det.
- Enterococci Det.
- Male Specific Coliphage Det.

FY2017 Ambient Groundwater Quality Results in Order of Increasing Confining Layer Thickness (clockwise)

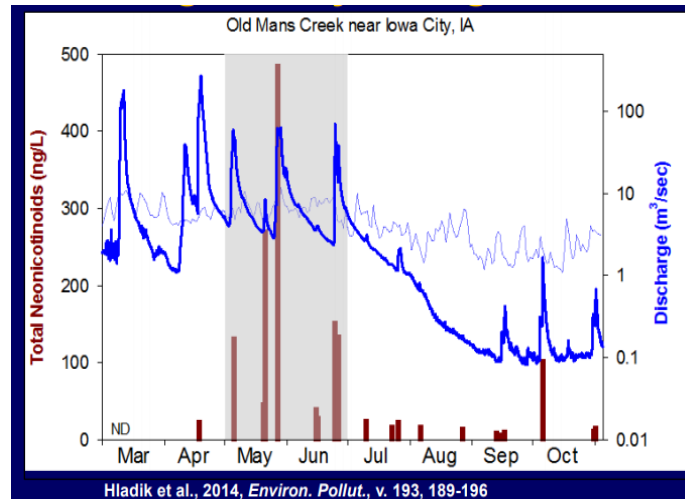

Coming Soon in FY2018:

- $N^{15} - O^{18}$ isotopic analyses for vulnerable wells with nitrate

- Po-210, Pb-210, U-235, U-238, Ra-226, gross Alpha, and gross Beta in buried sands and bedrock wells

- 3 sets of samples (Oct-Dec, April-June, July-August) for neonicotinoids in vulnerable wells

API Help Documentation

Introduction

The BioNet API is currently in development and has not been made 'public' yet.

The current version of the API is v1.

Sites

| API | Description |
|--|--|
| GET api/v1/sites?f={f} | Get all sites in the database. |
| GET api/v1/sites/{id}?f={f} | Get a single site |
| GET api/v1/sites/types | Returns list of all possible site types |
| GET api/v1/sites/statuses | Returns list of all possible site statuses |
| GET api/v1/sites/tags | Returns list of existing site project tags |
| GET api/v1/sites/tags/{id} | No documentation available. |
| GET api/v1/sites/by_type/{id}?f={f} | Returns list of sites by site type. |
| GET api/v1/sites/by_status?id={id}&f={f} | Get all sites having requested status |
| GET api/v1/sites/by_huc8/{id}?f={f} | Return all sites within a HUC8 watershed |
